

FactoryBench: Four-Level Causal Evaluation Hierarchy

Rigorous QA benchmark for LLM agents on causal machine understanding with industrial time-series data

Causal Evaluation Hierarchy

Strict dependency: success at Level N requires Level $N-1$

Increasing Causal Depth

L1

State Identification

Interpreting current machine states and detecting anomalies from sensor data.

L2

Intervention Reasoning

Predicting the immediate impact of control changes or faults at the present timestep.

L3

Counterfactual Analysis

Simulating alternative historical timelines to assess hypothetical past conditions.

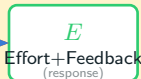

L4

Decision Support

Synthesizing multi-step recovery procedures using sensor fusion and technical manuals.

Physical Causal Schema

Healthy: $E = f(S)$ — Fault: empirical deviations from $f(S)$

Faults manifest as $\|E - f(S)\| > \epsilon$ under context C

Scalable Q&A Generation Engine

80 Expert Templates
